Set dual monitors

Find your monitor names

```
swaymsg -t get_outputs
```

You'll see names similar to:

- **eDP-1** — laptop screen
- **HDMI-A-1** — external monitor

Create two scripts

Laptop only — create ~/.local/bin/laptop-only:

```
#!/bin/sh
swaymsg 'output HDMI-A-1 disable'
swaymsg 'output eDP-1 enable'
```

Both monitors — create ~/.local/bin/dual-monitor:

```
#!/bin/sh

# Enable both monitors
swaymsg 'output eDP-1 enable'
swaymsg 'output HDMI-A-1 enable'

# Laptop screen: right
swaymsg 'output eDP-1 position 0 0'

# Samsung monitor: left
swaymsg 'output HDMI-A-1 position -2560 0'
```

Replace the output names with yours. The 2560 position is just an example; adjust it to match your laptop screen's logical width and preferred arrangement.

Make both scripts executable:

```
chmod +x ~/.local/bin/laptop-only ~/.local/bin/dual-monitor
```

Sway supports enabling and disabling individual outputs this way.

Assign shortcuts

Add these lines to ~/.config/sway/config:

```
bindsym $mod+F5 exec ~/.local/bin/laptop-only
bindsym $mod+F6 exec ~/.local/bin/dual-monitor
```

Reload Sway:

```
swaymsg reload
```

Now you can use:

- **Super + F5** — laptop screen only
- **Super + F6** — laptop and external monitor
